SUMMARY

Data Analyst who turns raw, imperfect business data into decisions finance and operations teams can act on, using SQL, Python, Power BI and advanced Excel. Recent Order-to-Cash work surfaced **\$5.2M of recoverable cash** and a costly **7-day billing delay** from a 10,000-invoice receivables ledger. Also builds **AI-assisted Excel and reporting workflows** — using LLMs for formula generation, data cleaning, categorisation and summarisation — to cut manual analysis time on repeatable tasks.

SKILLS

Programming & Databases: Python (Pandas, NumPy, Scikit-learn), SQL, PostgreSQL

Analytics & BI: Advanced Excel (Power Query, PivotTables, lookups, dashboards), Power BI (DAX, star schema), Matplotlib, Seaborn

AI & Automation: AI-integrated Excel workflows, LLM prompt engineering for data cleaning & reporting, Python automation, ETL pipelines

Statistics & ML: Hypothesis testing, A/B testing, regression, classification, segmentation, feature engineering

Business Domains: Order-to-Cash, Accounts Receivable, DSO & AR aging, KPI design, stakeholder reporting

EXPERIENCE

LLM Post-Training Intern — Ethara AI [\[Certificate\]](#)

Apr 2026 – May 2026

- Ran **data preparation, analysis and evaluation** tasks supporting LLM post-training workflows across AI and data projects.
- Used **Python and SQL** on large-scale training datasets to surface data-quality issues and recurring failure patterns in model output.
- Produced evaluation reports that translated findings into recommendations used in post-training decisions.

PROJECTS

Order-to-Cash (Accounts Receivable) Analytics | Python, SQL, Power BI [\[GitHub\]](#)

Problem: finance could not tell how much of \$32.6M outstanding was genuinely owed, why collections were slowing, or where recoverable cash was hiding across 10,000 invoices.

- Proved **\$5.2M of cash had already been banked but never matched to an invoice** (270 payments, 152 customers) with a reconciliation test — records that a routine cleaning step would have deleted as junk, overstating customer debt.
- Quantified a self-inflicted **7.3-day billing lag** in the Services unit worth **~\$468K of working capital** and **~2 days of DSO**, and traced a **20.4% LATAM dispute rate** (3× baseline) to a price-list root cause unblocking **~\$3.38M** of invoice value.
- Cleaned and validated 10,200 raw rows to a reconciled dataset (zero orphan records, billed value preserved to the cent), engineered **22 analytical features**, wrote **15 SQL queries** (CTEs, window functions), and shipped a **3-page Power BI dashboard** with DAX measures for DSO, CEI, AR aging and collector performance.

Customer Churn Prediction | Python, Machine Learning [\[GitHub\]](#)

Problem: the business was losing customers without knowing which accounts were at risk while retention was still possible.

- Built a **logistic regression classifier at 89% accuracy** after full preprocessing, feature engineering and exploratory analysis, flagging high-risk customers before they lapsed.
- Converted model drivers into **targeted retention actions** by segment, so retention spend could be aimed at accounts that were both at risk and worth keeping.

Customer Shopping Behaviour Analysis | Python, SQL, Power BI [\[GitHub\]](#)

Problem: marketing had transaction data but no view of who its valuable customers were or which discounts actually worked.

- Analysed **3,900 transactions** in Python and PostgreSQL to profile spending patterns, product preferences, discount impact, repeat purchase and subscription behaviour.
- Delivered an interactive **Power BI dashboard** with customer segments, turning the analysis into targeting, loyalty and product-mix recommendations.

EDUCATION

B.Tech, Mathematics and Computing — Madhav Institute of Technology and Science, Gwalior

May 2023 – Present

CERTIFICATIONS

Data Science (Credit-Linked Course) — IIT Guwahati [\[Admission Letter\]](#)

Jan 2025 – Jan 2026

Data Analytics Job Simulation — Deloitte [\[Certificate\]](#)

Jun 2026
